

# Electronic 'Wire Tap'

---

LONG BEACH, June 13. — (INS)—Private Detective Keith Rogers says there is a new electronic device that makes "horse and buggy stuff" out of wire tapping.

He told the annual convention of the California Association of Private Investigators yesterday that the device can pick up a conversation 100 miles away without a microphone and, at the same time, transmit a picture of the speakers.

Rogers said that the extraordinary equipment already is being used by American and foreign intelligence agents and would be available to private eyes within a year.

He demonstrated a machine that records both ends of a conversation when merely pointed at a telephone.
